Today’s Presenters

Laurie Schoeman, Enterprise Community Partners

Jaimie Ross, Florida Housing Coalition
http://www.flhousing.org/

Armand Magnelli, Livable Housing, Inc.

Jonathan Wilson, National Center for Healthy Housing
Enterprise: Who We Are

Create opportunity for low- and moderate-income people through fit, affordable housing in diverse, thriving communities.

11 offices
570 employees
Columbia, MD national headquarters
Resilience-An Investment to Protect and Strengthen Our Communities
25 Years of Healthy Housing
NCHH’s 25th Anniversary Celebration

National Center for Healthy Housing
Through partnerships, community-based research, and advocacy, we work to secure healthy housing for all.

We recognize that in times of natural disasters, thoughtful and appropriate steps must be taken to protect the health of residents and workers. The recovery period is also an opportunity point to create healthier and more sustainable home environments.
How To Restore a Flooded Home

Addressing Mold & other health related hazards
Thanks to:

• Enterprise Community Partners
• NeighborWorks America
• The National Center for Healthy Housing
• Recover Rebuild

• And….. A download link to a digital version of this presentation will be provided at the end of the session.
Presented by:

Armand C Magnelli
Livable Housing, Inc.
3958 Little John Drive
York, PA 17408
717 747 3919
amagnelli@LivableHousing.com
Where are we?

By a show of hands - Who or whose clients:

- had water above the first floor level?
- has had access to their flooded house?
- has removed the flood damaged materials?
- has observed mold?
- had sewage present?
- has someone in their households with respiratory problems?
- intends to do renovation work themselves?
Agenda

1. Health and Safety Concerns
2. Safe Clean-Up and Rebuilding Strategies
3. Opportunities for Resilient, Healthy and Sustainable Housing
4. Resources
Basic Rules 1 (clean-up)

• Worker protection is Crucial, there are many health risks to avoid.
• It helps to understand how mold grows.
• Standard cleaning methods may work fine on mold.
• Sewage is extremely hazardous and requires disinfecting exposed surfaces.
Basic Rules 2 (rebuilding)

• The structure must be dry before you close in gutted walls
• There are additional treatments that will help to avoid future problems
• This is an opportunity to renovate to a healthier and more sustainable standard
When are People Exposed to Health Hazards?

1. When people return to inspect
2. When anything is disturbed
3. During clean-out
4. Living in the building
   (during clean-out and construction)

1. During construction
2. Living in the building post-construction
Potential Health & Safety Hazards from Flooding

• Mold (active or inactive)
• Bacteria/Black Water
• Standard Housing Hazards Compounded by Flooding & Demolition
  – Electrical
  – Structural
  – Contaminants
Health Issues During Clean-up and Renovation

• Lead Paint Hazards
• Asbestos
• Pests
• Bird droppings (e.g. Pigeons)
• Lack of Appropriate Personal Hygiene
• Risk of Physical Injury (structural, electrical, etc.)
The Major Health Risks When Working on Water-Damaged Homes

Physical Injuries

• Structural problems are common
• Open wounds are invitations to infections
  – Wear Protective Equipment
  – Current Tetanus Shots
  – Clean the Cut with Antiseptic
• Electric Shocks
  – Turn off the power
  – Generators present several hazards, follow directions
• Food and water is easily contaminated
The Major Health Risks When Working on Water-Damaged Homes

Mold’s Health Effects

• Damp homes and mold associated with:
  – Asthma development
  – Respiratory infection
  – Asthma exacerbation (asthma attacks)

• Suggestive evidence of association with:
  – Bronchitis
  – Allergic rhinitis (inflammation of nasal airways)

Source: World Health Organization
The Major Health Risks When Working on Water-Damaged Homes

Symptoms from exposure to Mold

- Upper respiratory tract symptoms (runny nose, watery eyes, sore throat)
- Coughing
- Wheezing
- Dyspnoea (shortness of breath)

Source: World Health Organization
The Major Health Risks When Working on Water-Damaged Homes

- **Lead Dust**
  - Often shows no symptoms
  - Watch for listed symptoms in Adults
- **Carbon Monoxide**
  - Fuel burning equipment (generators)
- **Propane tanks**
- **Car batteries**
1. The most important factor influencing mold growth is:

• A. Temperature
• B. Light
• C. Moisture or water
• D. Organic matter
Mold Quiz

2. Molds have the potential to cause health effects such as allergic reactions.
   - True
   - False
3. Personal Protective Equipment (PPE) is worn in order to limit mold exposure. Minimum PPE for mold remediation includes:

A. A helmet and gloves

B. Safety glasses, an N-95 respirator and protective shoes

C. A half-face negative-air respirator with a magenta (HEPA) filter, gloves, and goggles
4. Water-damaged furnishings and building components should be dried within 24-48 hours to prevent mold growth.

• True

• False
5. Mold cannot be eliminated from indoor environments. Some mold spores will be found floating through the air and in dust; however, they will not grow if moisture is not present.

• True
• False
Health Effects of Mold Exposure

• Allergic reactions and asthma attacks
• Effects from toxins released by molds
• Most vulnerable are:
  – Young children
  – The elderly
  – People with respiratory problems
  – Immune-compromised individuals
  – Pregnant women
Health Effects of Mold Exposure

An example of mold - Aspergillus

A genus of mold which can be found within indoor environments. Certain species are pathogenic (harmful to human health) and cause Aspergillosis (an infection, a growth, or an allergic response)

http://www.aspergillus.man.ac.uk
How Mold Grows

• Let’s spend a little time on the science behind mold growth.
• This is important to avoid making false assumptions about both the potential for growth and the strategies for treatment.
• The spores have enzymes on their surface that break down the damp organic matter into a food source.  
• Even “dry” spores can begin to absorb the food source.
• The combination of moisture and a food source allows the spore to germinate.
• The filaments (Hyphae) have enzymes that dissolve and absorb food as well, accelerating mold growth.
Phase 3 of Mold Growth

As the filaments continue to grow over a damp food source the organism generates additional water, helping to digest even more food.
Phase 4

- When the food source runs out, or when the moisture goes away, mold growth slows or stops.
- The spores then focus on reproduction, generating billions of offspring. And it begins again.

Source: ASHRAE Humidity Control Design Guide
Other terms and thoughts:

• The hyphae extend and intertwine to form a mass, which is called the mycelium.
• Mold spores can remain dormant for long periods of time, until the right growing conditions are available.
• Fragments of broken hyphae can also be transplanted to start growing new mold colonies.
• Remember that it’s the moisture on the surface of the food source that gets things started.
When are Mold Levels Highest?

Examples of 2 Flooded Homes

• Two homes located in the Gentilly neighborhood of New Orleans. *
• Owner occupied
• Each experienced different levels of flooding
HOME #1

- 2 story home
- Built in 1987
- Slab on grade construction
- Received up to a foot of flood water
- 2-3 ft of mold growth on first floor
HOME #2

- 1 story home
- Approximately 100 years old
- Raised on piers
- Received at least 5 ft of flooding
- Mold growth to ceiling
## Mold Sampling Results: Home #1

approximate live mold levels (CFU/m³)

<table>
<thead>
<tr>
<th>Location</th>
<th>Possession Removal</th>
<th>Before work next day</th>
<th>During demolition</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Living Room</strong></td>
<td>1,229,000</td>
<td>35,000</td>
<td>594,000</td>
</tr>
<tr>
<td><strong>2nd Floor</strong></td>
<td>313,000</td>
<td></td>
<td>15,000</td>
</tr>
</tbody>
</table>

**CFU/m³ = Colony Forming Units/Cubic Meter**
Mold Sampling Results: Home #2
approximate live mold levels (CFU/m³)

<table>
<thead>
<tr>
<th></th>
<th>Living Room</th>
<th>Outside</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pre-Work 11/1</td>
<td>34,000</td>
<td></td>
</tr>
<tr>
<td>Pre-Work 11/15</td>
<td>17,000</td>
<td>24,000</td>
</tr>
<tr>
<td>During demolition</td>
<td>&gt;6,000,000</td>
<td>36,000</td>
</tr>
</tbody>
</table>

< 1,000 CFU/m³ is typical indoor reading
1,000 CFU/m³ = 1,000 Colony Forming Units/Cubic Meter
Personal Hygiene is Very Important!

- Hand washing - towelettes
- Clean “Break Areas”
- Protective Clothing can spread all the Bad Stuff
Creating a Healthy Home

A Field Guide for Clean-Up of Flooded Homes

Created by the National Center for Healthy Housing
Please read the Acknowledgements and Disclaimer

• Created by three national housing organizations
  – National Center for Healthy Housing
  – NeighborWorks® America & its local affiliate Neighborhood Housing Services of New Orleans
  – Enterprise Community Partners

• Funding by the Home Depot and Robert Wood Johnson Foundations.

• 4 homeowners volunteered their homes

• Other participating organizations:
  – Columbia University and Tulane University
  – Little Sisters of the Assumption Family Health Services, Inc.
    and Microecologies, Inc
  – URC, Inc.
  – Community Resources
What Can You Do Yourself & When to Hire a Professional

It is our recommendation that trained mold remediation professionals do the mold clean up if mold growth covers more than 100 square feet, or a 10 ft. by 10 ft. area.
Tips for Hiring Mold Remediation Professionals (P. 1)

• Know your State regulations. Some states require licensing.
• Avoid contractors that recommend fogging or spraying
• Whenever possible, get more than one quote
• Get references on similar jobs & check those references
Tips for Hiring Mold Remediation Professionals (Cont.)

For the Final Inspection:

• Use a highly qualified person for the final inspection and clearance testing.

• In some States, like Louisiana, that person must not work for the mold remediation contractor.

• Require a written report of the inspection findings.

• This report lets you know that it is safe to rebuild.

• You should also save this report in case you need to show it to prospective buyers or tenants.
Tips for Hiring Mold Remediation Professionals (Cont.)

Two Agencies that Certify Mold Professionals:

• The Restoration Industry Association - Mold Remediation Technician (MRT) and Mold Remediation Supervisor (MRS) - http://restorationindustry.org/

• American Council for Accredited Certification www.acac.org - Investigator & Contractor Certifications
Other Professionals:

Asbestos must be removed by a certified professional.

In some states, contractors who apply borate solutions, like Termite Prufe or BoraCare, need to be licensed pest control operators.
Worker & Occupant Safety

People with asthma, mold allergies or other respiratory conditions, people with weakened immune systems, children and pregnant women SHOULD NOT do this work and MUST remain out of these homes until the work is complete. They are especially vulnerable to the hazards found in flooded homes.
Protection from Environmental Health and Safety Threats (P. 4)

Wear a Respirator

- N95 or N100 only for < 15 min Exposure when you are not disturbing mold
- Half-face Negative Air with a HEPA Filter (magenta)
- Powered Air Purifying Respirator (PAPR)
- Carefully follow instructions for the device you use
Wear a Respirator,

But...... not everyone’s respiratory system is up to the task. Please consult your physician prior to using a respirator, or if you experience respiratory discomfort wearing a respirator.

OSHA regulations regarding respirators and other PPE apply for contractors.
Protection from Environmental Health and Safety Threats

• Eye Protection
  – Wear goggles, safety glasses or full face shield
  – Wear a hat with a brim
  – Keep eyewash handy

• Ears
  – Use earplugs

• Feet
  – Heavy work boots
  – Not tennis shoes
Protection from Environmental Health and Safety Threats

• **Head**
  – Use coverall with a hood, and/or a hat with a brim

• **Hands**
  – Use heavy, waterproof, cut resistant gloves
  – Wash your hands and face before eating, drinking or smoking

Protection for the people you go home to

• Wear disposable coveralls
• Clean all reusable equipment
• Wash clothing in hot water & detergent separately
Work Stages in the “Creating a Healthy Home” Field Guide

1. Pre Work Inspection - Pages 6, 7, 8
2. Before Work Begins - Pages 8, 9
3. Site Preparation - Pages 9, 10, 11
4. Clean-Out — Page 11
5. Gut Tear-Out Procedure - Pages 12, 13
6. Pre Construction Cleaning and Treatment - Pages 13, 14, 15
7. Selective Tear Out and Prep before Restoration - Pages 15, 16, 17
8. Restore Possessions Page 17
1. Pre Work Inspection

- Check for Hazards
  - Structural
  - Electrical
  - Natural Gas
  - Water
  - Etc.
- Where is the Water Damage?
- Where is the Mold?
- Are there LBP or Asbestos Risks?
- Can Architectural Details be saved?
- Can Personal Belongings be Saved?
2. Before Work Begins

- Purchase and order tools and supplies
- Plan for trash removal
- Set up a storage area for items to be saved
- Set up electricity
- Set up secure tool storage area
- Turn off gas
- Provide bathroom access
3. Site Preparation

Set up a safety and cleanup area

Put on your personal protection equipment
3. Site Preparation

Set up a “things-to-be-saved table”

Keep clean areas separate from the work areas

Lay a plywood path
3. Site Preparation (Ventilation Example)

Place a window fan in a first floor window blowing out.

This is the Clean Room

These rooms are moldy and being worked on
4. Clean-Out

- Ventilate
- Remove small furniture and objects on the floor
- Remove large furniture
- Remove appliances
- Cut and remove wall to wall carpet
- Clean out closets, shelves, storage areas, and kitchen cabinets
5. Gut Tear-Out

• Many damaged homes contain valuable & historic architectural materials that are often of higher quality than what you can buy as a replacement.
• Saving historic materials that are in good condition and can be cleaned makes sense.
• But..... it may be less expensive to dispose of moldy building components.
• If you choose selective tear out, see Section 7.
5. Gut Tear-Out

- Remove and dispose of cabinets, shelves, doors and trim
- Tear down drywall or plaster ceiling
- Remove drywall or plaster from walls
- Clean up as you go

- Remove insulation
- Remove layers from floor
- Remove all dirt and debris
6. Pre Construction Cleaning & Treatment

- Prepare surfaces
- Vacuum all surfaces
- Wet clean wooden surfaces if needed (extreme mold conditions, chemical or sewage contamination)
- Disinfect all hard surfaces
- Treat surfaces with Borate solution
- Dry out the building < 15% moisture content for wood

- Treating with fungicides carries risks. Do not apply impermeable coatings > 5 PERM rating
6. Pre Construction Cleaning & Treatment

- Drying out the building may be a challenge, especially in hot humid climates.
- If you can afford the cost, commercial dehumidifiers and other restoration industry equipment will speed the process.
- If the commercial equipment is not an option, the LSU Ag Center recommends combining of air-conditioning & electric resistance heat post cleaning & treatment stage.
Moisture Meters

• Most moisture meters have a scale that is calibrated on wood and covers a range of moisture content as a %.
• When testing the moisture content of materials other than wood, some meters have a reference scale to adjust the %.
• Some meters accurately read multiple substrates.
HEPA Vacuum

- True HEPA vacuums are expensive investments for homeowners
- A reasonable level of HEPA Vacuuming can be performed using a Wet-Dry Vacuum with a HEPA filter.
- All of the major home centers carry several wet-dry vacuums that accept HEPA rated filters.
- Similar products manufactured by Shop-Vac and Sears.
Wet Cleaning Terms and Tips

• Wet Cleaning
  – Bleach may damage wood & some metals
  – Clean bare wood and metals with a non phosphate detergent. CDC recommends laundry or dishwashing detergent
  – Allow surfaces to dry

• Disinfect hard surfaces with bleach & non phosphate detergent, 1 cup household bleach with 1 gallon of water

• Use the 3 bucket system
Every product that we might recommend (borates, bleach, or the class of antimicrobials called quats (quaternary ammonium compounds like DDAC used in disinfectants) are regulated by EPA under the Federal Insecticide, Fungicide, and Rodenticide Act (FIFRA).
We strongly recommend caution in the use of regulated chemicals. Even when applied by mold professionals. Check the Safety Data Sheets (SDS) for information on health risks.
The category of chemicals called quats (quaternary ammonium compounds) are disinfectants used in mold clean-up.

2 Examples:

- DDAC (didecyl dimethyl ammonium chloride)
- ADBAC (alkyl dimethyl benzyl ammonium chloride)
Moldex - A Disinfectant Example

**Ingredients:** From Safety Data Sheet (SDS)
- Alkyl dimethyl benzyl ammonium chloride (ADBAC)
- Didecyl dimethyl ammonium chloride (DDAC)
- Alkyl dimethyl ammonium chlorides
- Dioctyldimethylammonium chloride

**Hazard Statement:**
Harmful if swallowed.
Toxic in contact with skin. Causes severe skin burns and eye damage. Causes serious eye damage. Harmful if inhaled. May cause damage to organs. Very toxic to aquatic life. Toxic to aquatic life with long lasting effects.
Borate Treatment Products

Termite-Prufe

- Copper Brite, Inc., P.O. Box 50610, Santa Barbara, CA 93150, 805-565-1566 (www.copperbrite.com).
- Comes in a 1 pound container, which makes one gallon of treatment solution.
- 1 gallon of solution will cover about 200 square feet.
- About 14 pounds is needed for an average house, at a cost of about $130.
Termite Prufe – Borate Application

www.copperbrite.com/termite.html
Borate Treatment Products

• Bora-Care: Nisus Corporation, 100 Nisus Drive, Rockford, TN 37853, (800) 264-0870. (www.nisuscorp.com).
• The Nisus Corporation website lists local distributors.
• Also marketed as “Boracare/Moldcare” a combination Borate and DDAC treatment.
  – Provides additional protection over Borates alone (for areas that are likely to see regular elevated moisture levels).
Recommendations

• Clean and dry surfaces and wood dried to 15% moisture content or less is the highest priority.

• Wood that is likely to be subject to high moisture levels, such as in unsealed crawl spaces, would benefit from treatment with the Bora-Care/Moldcare product, but it must be applied by a Licensed PCO.

• Any other wood surfaces would benefit, but follow the instructions!
Recommendations (cont.)

• Again, clean and dry surfaces and wood dried to 15% moisture content or less is the highest priority.

• An easy to apply Borate treatment such as Termite Prufe, applied as a Fungicide, adds additional protection at minimal cost.
Foster’s 40-50

Note: Fosters makes numerous products that might be useful in rehabilitation post flooding.

http://fosterproducts.com/foster-products/
Dealing with Black Water (sewage)

• You’ll need waders of some sort & respiratory protection
• Pump out the water (methane is a hazard!), and shovel out the remaining solids
• Scrub down the walls (working floor drains help)
• CDC recommends cleaning with hot water and laundry or dishwashing detergent
• A bleach solution 1 cup to 1 gallon of water is an option, remember bleach can damage some materials. (wear your respiratory protection & do not mix with ammonia)
Dealing with Black Water (sewage)

• Ventilate basements **EXTREMELY** well (big fans and all access doors and windows kept open for a period before entry and the entire time during cleanup).

• Unfortunately, there are no air-purifying respirators that protect against sewer gas exposure.

• There may be insufficient oxygen.

• At least one additional person would need to be present immediately outside the space in case the person in the basement needs help.
7. Selective Tear-Out & Prep Pre-Restoration

- Clean up as you go
- Open attic
- Open crawl space
- Components to consider for removal:
  - Drywall
  - Plaster walls
  - Insulation
  - Kitchen cabinets and countertops
  - Kitchen and bathroom fixtures
  - Wood flooring
  - Ceramic Flooring
  - Wood windows, doors and trim
  - Repair/replacement T & G Floor
  - HVAC
8. Restore Possessions

- Wood furnishings
- Clothing, drapery and other cloth
- China, glass, jewelry, porcelain and metal possessions
- Electric appliances
- Small valuables
Rebuilding with Resiliency and Sustainability in mind

Choose components that:

• Have a longer life cycle
• Are resistant to moisture damage
• Contain fewer contaminants
• Are easily cleanable
• Require less maintenance
Consider These Options

• Insulating
• Air Sealing
• Low VOC products
• Spot & Whole House Ventilation
• HVAC and Domestic Hot Water Upgrades
• Better finishes, especially in high use areas
Materials for Rebuilding

• Insulation of the building envelope:
  – Fiberglass, Rockwool, Cellulose, Rigid Foam Boards or Spray Foam?

• Wall finishes
  – Standard drywall or Paperless drywall? ($7.70 versus $16 for ½” 4’X8’ sheet)

• Flooring
• Many air leaks are effectively chases in the wall framing that act like chimneys sucking hot air.
• The Stack Effect adds to the problem.
Air Sealing – 7 Reasons (a 7-fer)

1. Air leaks waste energy
2. Air leaks are a comfort issue (drafts)
3. Air sealing is also fire stopping (a code requirement)
4. Air leaks transport moisture at very high levels
5. Many pests can be kept out by careful sealing of air leaks (IPM)
6. Air leaks can carry contaminants (from attic, crawl space, garage, etc.)
7. Addressing air leaks has a very good cost/benefit ratio
Air Sealing

Typical examples of leaks:

• Plumbing chases
• Holes drilled for electrical cables
• Wall penetrations for electrical boxes, etc.
• Space around ductwork and flues
Seal Plumbing & Electric Penetrations

• Seal penetrations with expanding foam or caulk
• Seal flues with sheet metal
Insulation

Issues with batt insulation

• It costs more to do it well, but it pays to install batt insulation correctly.

• Batts are a challenge to install around obstructions.

• 40 to 60% improvement in performance if you do it well.

• Small gaps in insulation, say 5%, can create almost a 50% performance penalty.
What’s wrong with this picture?

Poorly Installed Batts
This is a Cellulose snow storm.
• Low cost
• Green
  • Recycled
  • Pest proof
• Requires little equipment
  Machines available through distributors/home centers
• Note the baffles in the eves
Spray Foam on Cathedral Ceiling
## 2 Types of Spray Foam

<td>.88 perm @ 3.00”</td>
</tr>
</tbody>
</table>
Spray Foam on Frame Walls
Damp Spray Cellulose or Fiberglass
Dense Packing Cellulose or Fiberglass

- Dense Packing = 3.5 lb/ft³
- Use 2 holes per wall cavity per level
- Dense Packing also accomplishes air sealing
Windows and Doors

• The “pay back” for replacing windows and doors is rarely as high as insulation and air sealing

• There are of course other reasons to replace them:
  – LBP
  – Market expectations
  – Security
  – Maintenance
  – Tilt windows are easier to clean
  – They’re missing........
Use duct mastic on seams & joints of ductwork, and between flex duct liner and metal boots.
Healthy Living Environment

The 8 Principles of Healthy Housing

1. Dry
2. Clean
3. Safe
4. Well ventilated
5. Contaminant-free
6. Pest-free
7. Well maintained
8. Thermally controlled
Healthy Living Environment

• Control Moisture
• Provide Ventilation
  – Bathroom fans
  – Kitchen Fans
  – Whole house ventilation
  – Sometimes, make-up-air
• Use IPM to control Pests
• Size HVAC Equipment appropriately
• Control hazards like CO, LBP and Radon
• Use Low VOC paints, caulks & sealants
• Use Low formaldehyde materials
Site Improvements that Control Moisture

- Drainage away from the foundation is crucial
- Gutters, Downspouts and Grading work together
- Look for signs of drainage issues and opportunities to move water away from the house
Vent Exhaust Fans to the Exterior

- Replace existing bath fans with new energy rated fans vented directly to the outside
- Replace existing range hoods with new energy rated units vented directly to the outside
Whole House Ventilation Options

- Constant background exhaust ventilation from a centrally located bathroom fan
- Supply ventilation by adding a fresh air intake to the return air system
- Balanced ventilation from a Heat Recovery Ventilator (HRV) or Energy Recovery Ventilator (ERV)
- Possibly adding make-up air inlets if the house is tightly air-sealed
Dryer Vent Ducted to the Outside

- Replace plastic ductwork with metal
- Vent clothes dryer to the outside
- The dryer vent must be rated for gas if the clothes dryer is gas
- Make dryer vent runs as short as possible
Colonizing organisms must be controlled by changing the carrying capacity of the building – intervening in food, water, shelter or dating bars.
Tools of the IPM Trade
Sealing penetrations in the building envelope.
